Contemporary Teacher's Role Student Motivation Technology

A B S T R A C T

This article explains the dynamics of motivation in education with an emphasis on contemporary learning theories. Motivation is identified as the main psychological factor that influences the learning process. This article also discusses contemporary educational theories, such as constructivism, connectivism, self-determination theory (SDT), and social cognitive theory. This research uses a literature study methodology to analyze concepts and determine their implications for student motivation in an educational context. Research findings show that SDT theory prioritizes autonomy, social competence, and interpersonal relationships as key components for increasing student motivation. In education, Social Cognitive Theory emphasizes observation and modelling, while Constructivism advocates active learning and the relevance of material to students' daily lives. Especially in the digital era, connectivism emphasizes the importance of information networks and collaboration in education. Integrating key aspects of these theories can provide a foundation for responsive and holistic learning strategies, creating learning environments that are stimulating, relevant, and motivating for students across the educational spectrum.

Introduction

Education is the foundation for helping individuals develop and preparing them to face life's challenges. One of the main psychological factors that significantly influences the learning process is motivation (Schunk, 2012). Motivation is the main driving force behind an individual's ability to learn, grow, and achieve their goals (Uno, 2006). In this context, we will examine the dynamics of motivation in education with an emphasis on contemporary learning theories. These theories not only understand motivation as intrinsic or extrinsic factors but also consider psychological and social factors that contribute to the complexity of motivation in the educational context (Ena & Djami, 2021). The effectiveness of the teaching and learning process is greatly influenced by the dynamics of motivation in the classroom (Rike Andriani, 2019). Especially considering current trends and research, educators and students need to be aware of the latest educational theories to improve teaching standards (Uno, 2006). In this context, we will discuss several aspects related to motivation in education, such as environmental influence, teacher influence, and technology as factors that might influence and change a person's motivation. Technological developments and shifts in educational paradigms have had a significant impact on the dynamics of learning motivation (Juwandi, 2020). The use of technology in education creates new opportunities, including opportunities to increase student motivation (Rahmawati & Nurachadija, 2023). By referring to contemporary educational theory and technological advances, this article will examine how technological advances can be a catalyst for motivation in education. Apart from that, this article will discuss the importance of teachers in inspiring students. The role of a teacher is not only limited to providing information;
they can also act as facilitators who can increase students' enthusiasm and goals in learning (Arviansyah & Shagena, 2022). By focusing on interactions between teachers and students, we can understand how the dynamics of student motivation in education can be strengthened through teacher-student interactions that are centred on student growth and development (Darman, 2020). From this perspective, this article will not only discuss general theories of education but will also highlight the practical application of these theories in educational contexts. In this way, students can relate theoretical concepts to real-world situations in a modern educational context. Through an in-depth understanding of the dynamics of motivation in education, it is hoped that a strong foundation will be created to increase the effectiveness of teaching and develop individual potential.

Research Methodology

This research was conducted using the literature study method. A literature review is a written work that provides various information intended to provide a general overview. A literature review provides readers with information about previous research projects that are closely related to the research being conducted and connects current research projects to existing literature (Mahanum, 2021). This research is based on books, journals and articles including research findings to provide an overview of what is being studied (Wijaya, 2019). Through literature studies, several summaries of theory and literature that are relevant to the study topic are presented, especially those that are the main emphasis of the research carried out, in the form of analysis and study of important aspects contained in the dynamics of motivation in education.

Results and Discussion

The development and dynamics of motivation in education is an increasingly important research topic, especially in relation to the development of contemporary learning theories. Understanding how these theories influence changes in student motivation is an important component in efforts to increase learning effectiveness.

Self-Determination Theory (SDT)

Self-Determination Theory (SDT) proposes a framework that integrates three main dimensions: autonomy, competence, and social relationships as key elements in motivating individuals, especially students, in educational contexts. This study consistently develops these concepts and highlights their positive impact on student motivation (Guay, 2022). In the context of autonomy, research shows that by giving students choice and control over their learning process, they can increase their intrinsic motivation and sense of responsibility (Schunk, 2012). Research on autonomy subjects in the classroom shows that students who are truly interested in learning have higher levels of motivation because they are better able to formulate thoughtful questions about how to learn (Pratama, 2019). The second aspect of SDT, namely competency, emphasizes the need to provide assistance that is appropriate to the student's level of ability. Research shows that providing tasks that require competence but are also challenging can increase intrinsic and extrinsic motivation (Ryan & Deci, 2020). This is in line with SDT principles which emphasize the importance of learning experiences that foster perseverance and success (Guay, 2022). Second, social relationships influence people's need to interact with other people. Research findings show that creating a social support network that strengthens interpersonal relationships can increase student motivation and engagement (Widya Ph & Sawitri, 2018). Collaboration, social support, and cooperative learning are important factors that can lead to positive social interactions among students (Wattanawongwan et al., 2021). Using SDT principles can create an educational environment that prioritizes increased self-control, improved social skills, and increased student engagement. According to this perspective, SDT theory offers a powerful framework for managing the development of teaching practices that enhance student motivation and holistic development (Guay, 2022).

Social Cognitive Theory

Social Cognitive Theory emphasizes the importance of effective observation, modeling, and self-reflection in student learning and motivation (Stajkovic & Sergent, 2019). This research has confirmed the hypothesis that creating communities where students can experience success and growth may have a positive impact on their motivation (Schunk & DiBenedetto, 2020). Research on the efficiency of human behavior reveals the idea that when students observe others with effective behavior, they gradually lose their own abilities (Hamzah et al., 2023). This study confirms that students' positive perceptions can be increased by listening to the skills and experiences of their teachers or mentors, thereby increasing their motivation to achieve higher standards (Komol & Suwanpathama, 2020). The observational approach in this theory suggests that students can learn through discussion and understanding of other people's experiences (Stajkovic & Sergent, 2019). Research on the use of teaching methods that emphasize observation and analysis, such as case studies or simulations, encourages students to learn more and be more motivated to do so (Cents-Boonstra et
al., 2021). Understanding modelling as a central idea in Social Cognitive Theory shows that students consistently ignore the experiences and opinions they see in the form of authoritative figures, such as teachers (Nabavi & Bijandi, 2012). In this context, it highlights the critical role of a mentor as a model and source of inspiration (Siona & Rustandi, 2023). Teachers who provide positive reinforcement, foster community, and model good behavior for students can have a positive impact on their motivation (Jainiyah et al., 2023). Social Cognitive Theory research also emphasizes the need to reduce structural bias in increasing student motivation (Ningsih, 2023). Negative reinforcement that focuses on practice and improvement may have a positive impact on students' learning motivation (Yuliati et al., 2019). By defining these concepts, Social Cognitive Ability Theory offers a valuable working tool for creating a motivating learning environment where students can understand, experience success, and be inspired by effective guidance from teachers and their learning environment (Ningsih, 2023).

**Constructivism theory**

Constructivism theory, which advocates active and focused student learning, draws inspiration from various studies that show the effectiveness of this approach in increasing student understanding and fostering intrinsic motivation. Numerous studies show that providing students with opportunities to engage in independent exploration and independent research can help them understand course material better (Schunk, 2012). According to Bandura's research in The Social Learning Theory, modelling, observation, and social interaction all have a causal influence on the learning process (Lesilolo, 2019). The concept of the Proximal Zone of Learning (ZPD) developed by Vygotsky also supports the idea that student learning outcomes can be improved by providing assignments that are appropriate to their level of difficulty and can be assessed through collaboration (Payong, 2020). The problem-based learning (PBL) approach also emerged as a direct application of constructivism, where students work together to solve problems to deepen understanding of the material (Schunk, 2012). Within the framework of neuroconstructivism, research shows that learning difficulties can strengthen brain structure and increase cognitive capacity (Pratiwi et al., 2022). Furthermore, research on the importance of reflection in constructivist learning shows that students who actively challenge their learning experiences tend to internalize their knowledge in a more effective way (Patty & Que, 2023). Students’ daily lives were also used as the focus of the research, where material relevant to students' lives was used to increase their intrinsic motivation and aversion. By adhering to these principles, constructivism theory developed into a kind of teaching methodology that not only encourages students to become active learners but also increases their level of awareness and attention throughout the learning process (Schunk, 2012).

**Connectivism Theory**

Connectivism theory, especially relevant in the digital era, presents an approach that emphasizes the importance of information networks and connectedness in education (Ferdiansyah et al., 2022). Research refutes the theory that technology integration can have a positive impact on student motivation and provide more flexible access to knowledge (Sarnoto et al., 2023). One study that supports connectivism theory is an investigation of the impact of social media use in an educational context (Mendoza et al., 2022). This study shows that interaction via social media platforms can facilitate information sharing and peer collaboration, thereby creating a dynamic and connected learning environment (Faturtama & Abidin, 2023). Apart from that, research on MOOCs (Massive Open Online Courses) also challenges connectivist theory. MOOCs enable open access to course materials through distance learning platforms, enabling participation from various geographic locations and distance learning locations (Ismail et al., 2018). This is in line with connectivism which emphasizes the importance of having flexible access to learning materials (Faturtama & Abidin, 2023). Sensitivity-based connectivism theory offers educational strategies that adapt to dynamic changes in information and technology (Sarnoto et al., 2023). With an emphasis on networks and consequences, this theory provides a foundation for the development of effective and relevant educational strategies to overcome the challenges of teaching in the digital era (Alam, 2023).

**Conclusion**

This research explores the development and dynamics of motivation in education with a focus on contemporary learning theories. Within the Self-Determination Theory (SDT) framework, research identifies that providing autonomy to students in the learning process can increase intrinsic motivation and responsibility. The competency aspect is also described as key, emphasizing the need for assignments that are challenging and commensurate with the student's abilities. Social relationships in SDT prove that creating a social support network can increase student motivation and engagement. Meanwhile, Social Cognitive Theory highlights the role of observation, modeling, and self-reflection in student motivation, with an emphasis on establishing communities that support growth. Research also shows that teachers as models and sources of inspiration have
a positive impact on student motivation. Constructivism theory shows that active learning and a focus on independent exploration can increase student motivation, with the Proximal Learning Zone approach and problem-based learning approach as implementation. Additionally, Connectivism Theory explores the positive impact of technology integration, particularly through social media and Massive Open Online Courses (MOOCs), in increasing student motivation and connectedness in a dynamic learning environment. This research presents these concepts as working tools to increase learning effectiveness and student motivation in the context of contemporary education.
